

**WHAT IS AWS LAMBDA?**

# ABOUT ME:

## Thaw Zin Myo

### Now:

- Working as Junior DevOps Engineer
- Working and Studying with top-notch technologies - Cloud, Containerization, Microservices, Serverless, Observability, Cost Optimization and IaC

### At BIM:

- Worked as Solutions Engineer
- Experienced with Cloud, Network, Storage, Endpoint Security Solutions, and Server Technology for Banks, Enterprise Company

### At SCS:

- Worked as Infrastructure Engineer
- Experienced with Network, VPN Solutions, Storage, Server Technology, and EMV Personalization Systems for Banks, Enterprise Company

# Lambda Explained

What is it? How's to apply?

## Agenda:

- Before Serverless!
- What is Serverless?
- What is Lambda?
- What are the benefits of Lambda?
- Its' function and feature!
- Limitation!
- Demo!
- Quiz

# Before Serverless?

How Serverless Architecture patterns with AWS  
Lambda are the next evolution of Application Design?

Which OS should my server run?

When should I decide to scale out my servers?

Should I tune OS settings to optimize the performance?

Should I tune OS settings to optimize my application?

How will I keep my server OS patched?

How much-remaining capacity do my servers have?

Which users should have access to my servers?

How should I implement for dynamic configurations changes?

# AGE OF SERVERS

What size servers are right for my budget?

How will the application handle for getting hardware failure?

How can I control access from my server?

How many servers should I budget for?

What size server is right for my performance?

How will new code be deployed on my servers?

When should I decide to scale up on demand?

# What is Serverless?

No servers to provision or manage

Pay for Value  
(charged only for execution time)

Scale with Usage

No idle/cold server  
(run function code on demand)

Bring your own code  
(provide function code to lambda)

Availability and Fault  
tolerance build-in

WHAT IS AWS COMPUTE OFFERING?

# Computing

**Amazon Elastic Compute Cloud  
(Amazon EC2)**

**Amazon Elastic Container  
Service (Amazon ECS)**

**AWS Lambda**

# WHAT IS AWS LAMBDA?

Serverless, Stateless, Event-Driven Compute Service

*"AWS Lambda lets you run code  
without provisioning or managing  
servers"*

# Supported Languages!

# Event Sources

- S3
- API Gateway
- Kinesis
- SNS
- SQS
- CloudWatch
- DynamoDB
- Cognito
- etc...

# ways to invoke lambda function

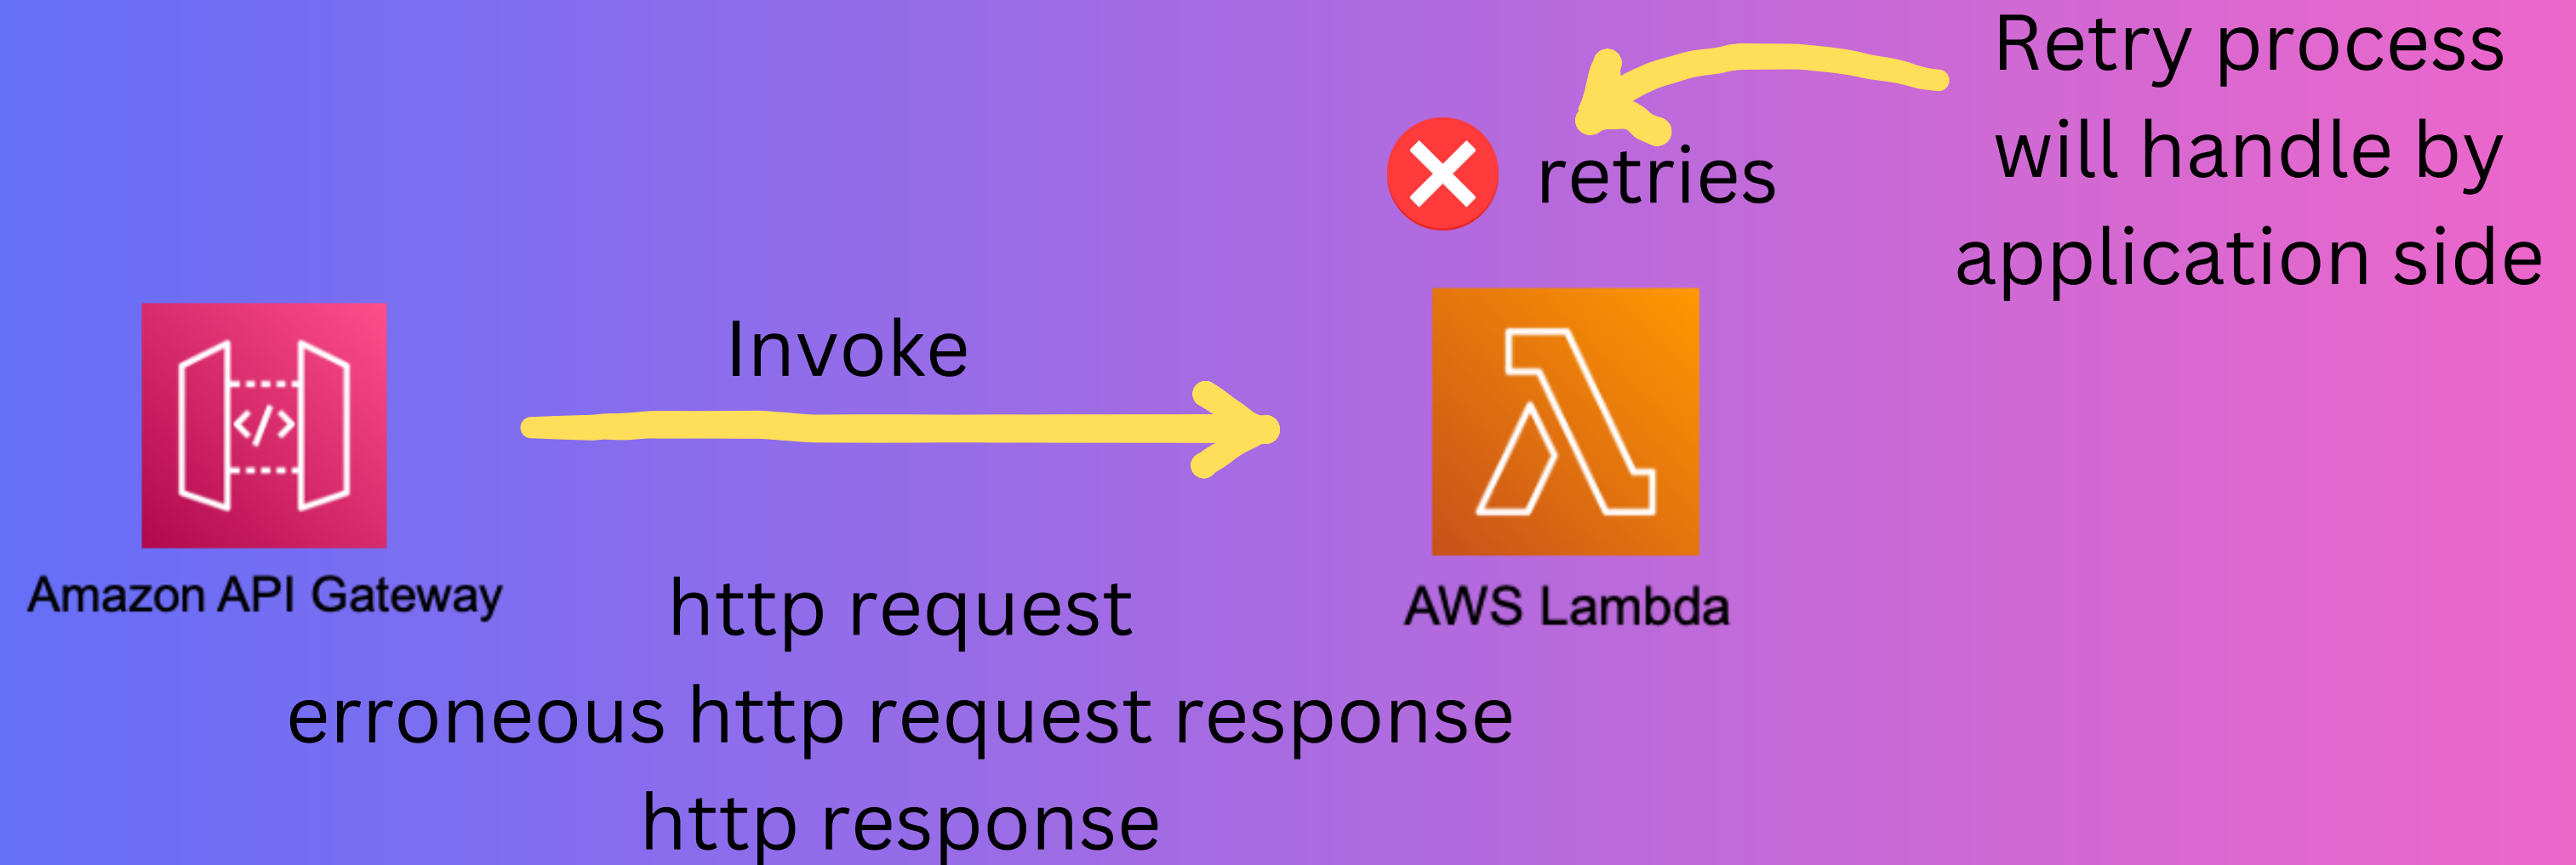

RequestResponse  
( synchronous )

Event ( asynchronous )

## Push model source type: (Synchnorous)

# Push model source type: (Asynchnorous)

Invocation permission

erroneous request

retries

AWS Lambda

After 3 retries,

Dead Letter Quqe

Execution Role

Amazon CloudWatch

Based on SUCCESS or FAIL

Destinations

Event-Bridge

SNS

erroneous can refer to code that contains bugs or errors that cause it to behave incorrectly or produce unexpected results

# Pull Model

## Streams

Dynamo DB

Kinesis Data  
Stream

## Queues

Amazon Simple  
Queueing Service

# Pull Model

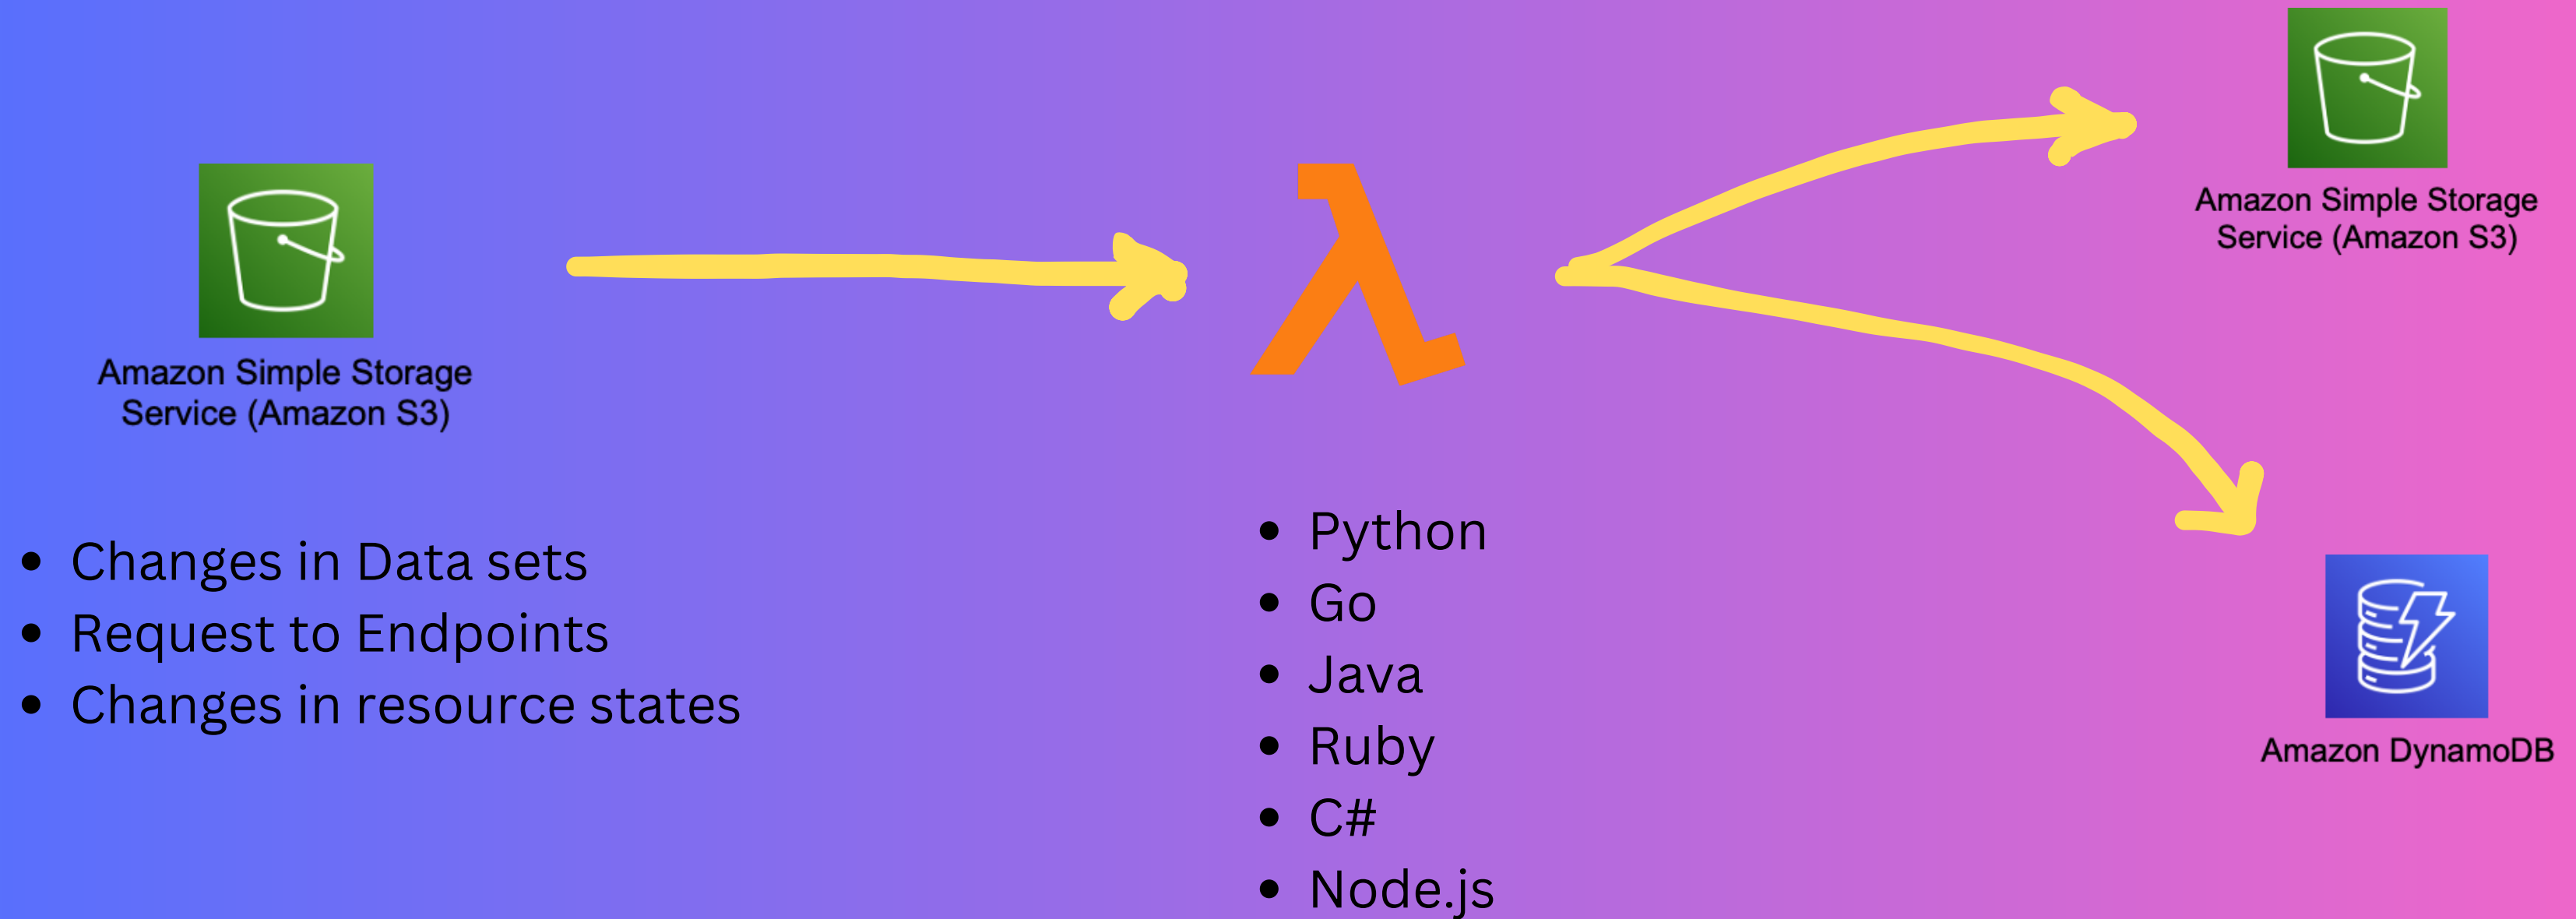

Amazon Simple Queue  
Service (Amazon SQS)

AWS Lambda

# Serverless Applications

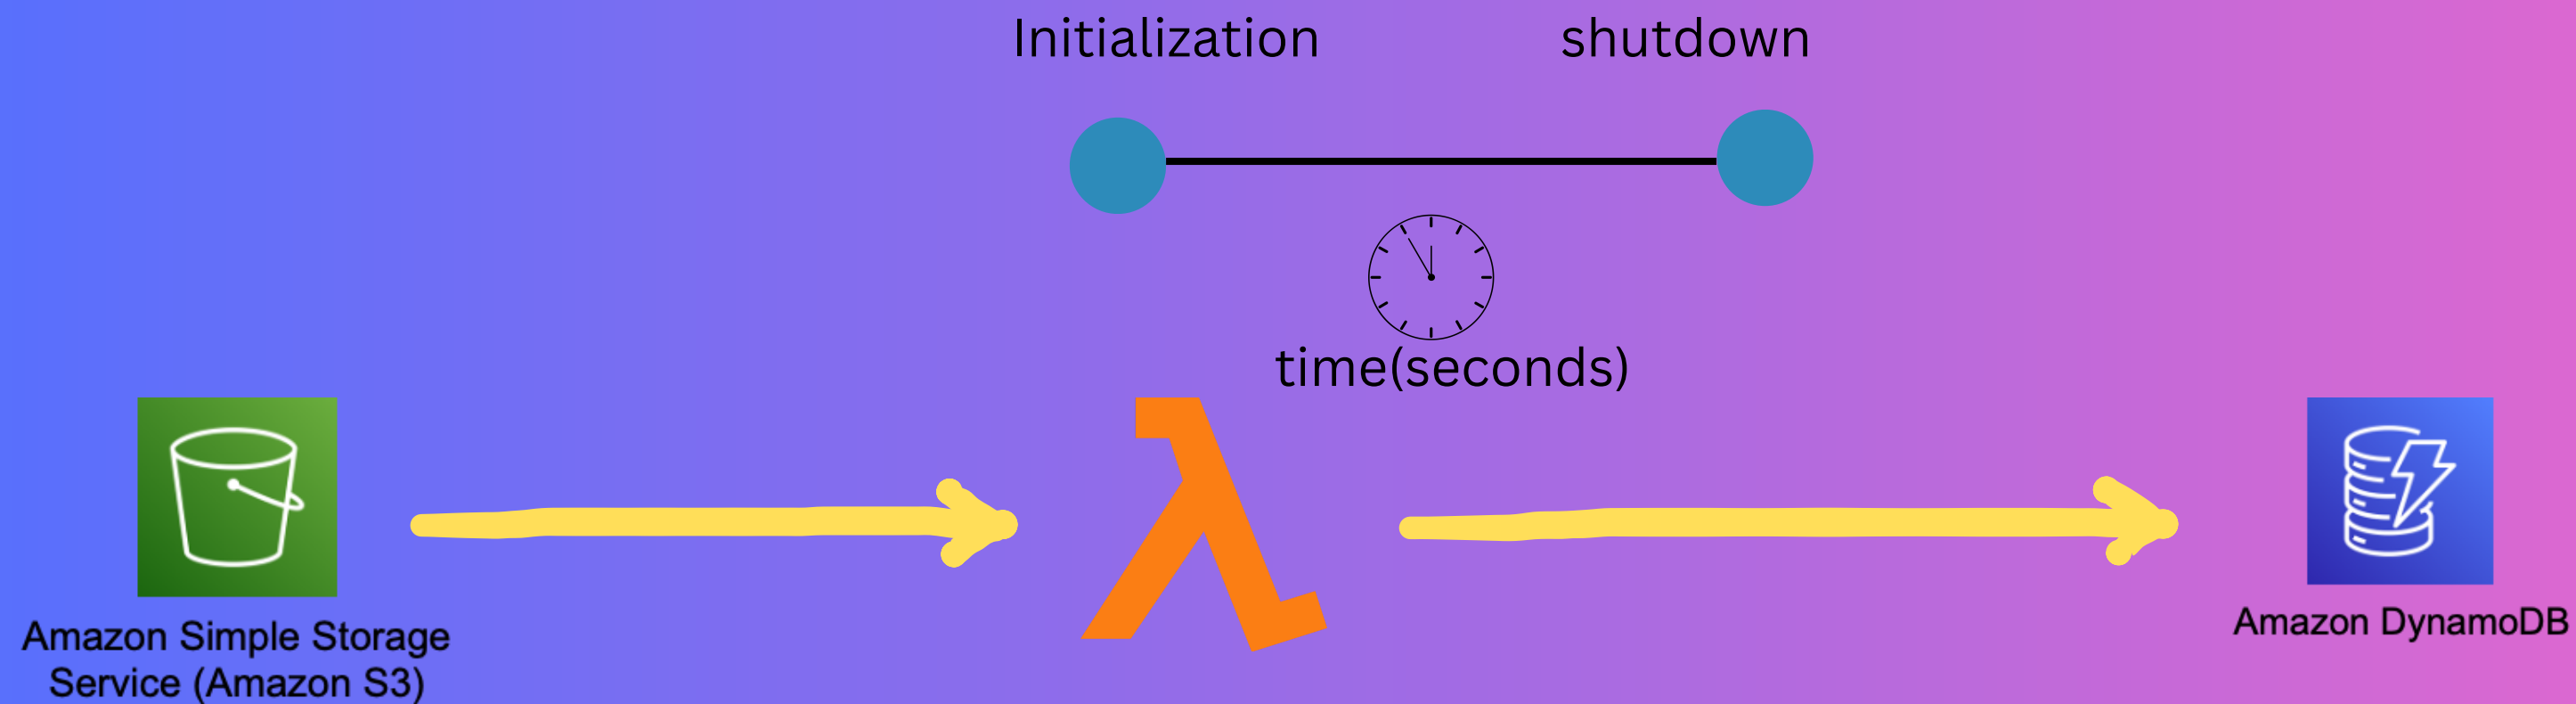

# Pricing:

Monthly Free Tier:

1 Million Requests  
400,000 Gigabit Seconds

# Parts of Lambda Cost:

1. Number of Requests
2. Gigabit Seconds (Amount of Time X Amount of Resources)

# Gigabit Seconds

If your existing function has dependencies on the x86-based CPU instruction set, you need to create a new deployment package for the arm64 architecture, with dependencies recompiled for the ARM instruction set.

# Ways to configure Lambda

AWS Management  
Console

AWS Command Line  
Interface (AWS CLI)

AWS Tools  
and SDKs

AWS CloudFormation

AWS Serverless  
Application Model

# Limitations

- Can Only run for 15 minutes

- 10 GB RAM Limit

- 10 GB Storage Limit

- 1000 Concurrent Limit

# Reserved and Unreserved Concurrency

# Concurrency

$$\textcircled{\lambda} = 1$$

$$\begin{array}{ccc} \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} \\ \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} \\ \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} \end{array} = 9$$

$$\begin{array}{cccccccccccc} \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} \\ \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} \\ \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} & \textcircled{\lambda} \end{array} = 36$$

Default, concurrency is 1000.

If you want more than 1000, request support.

In some Region 3000 but temporary.

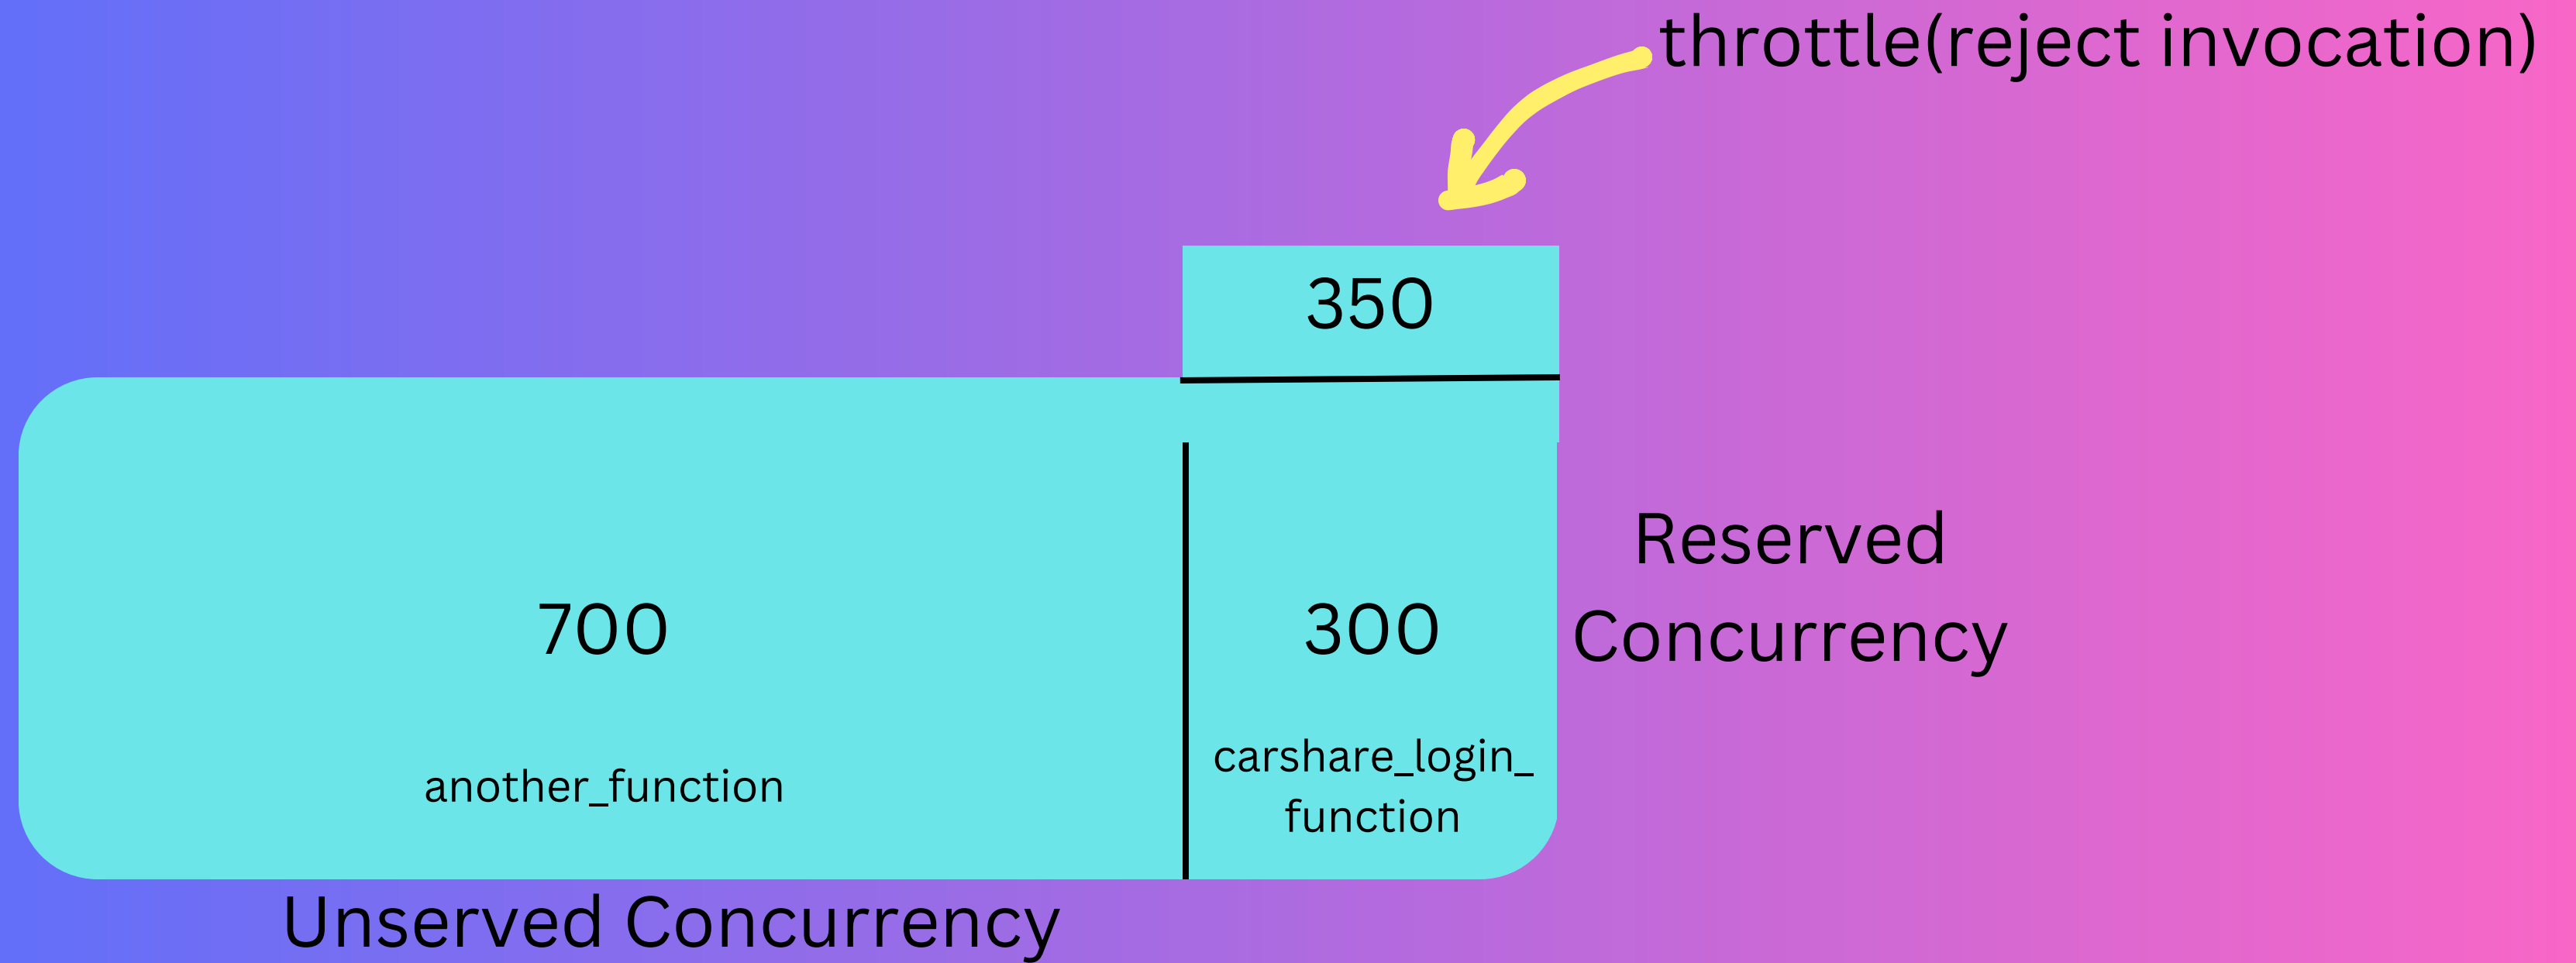

Minium unreserved concurrency is 100..

Unserved Concurrency

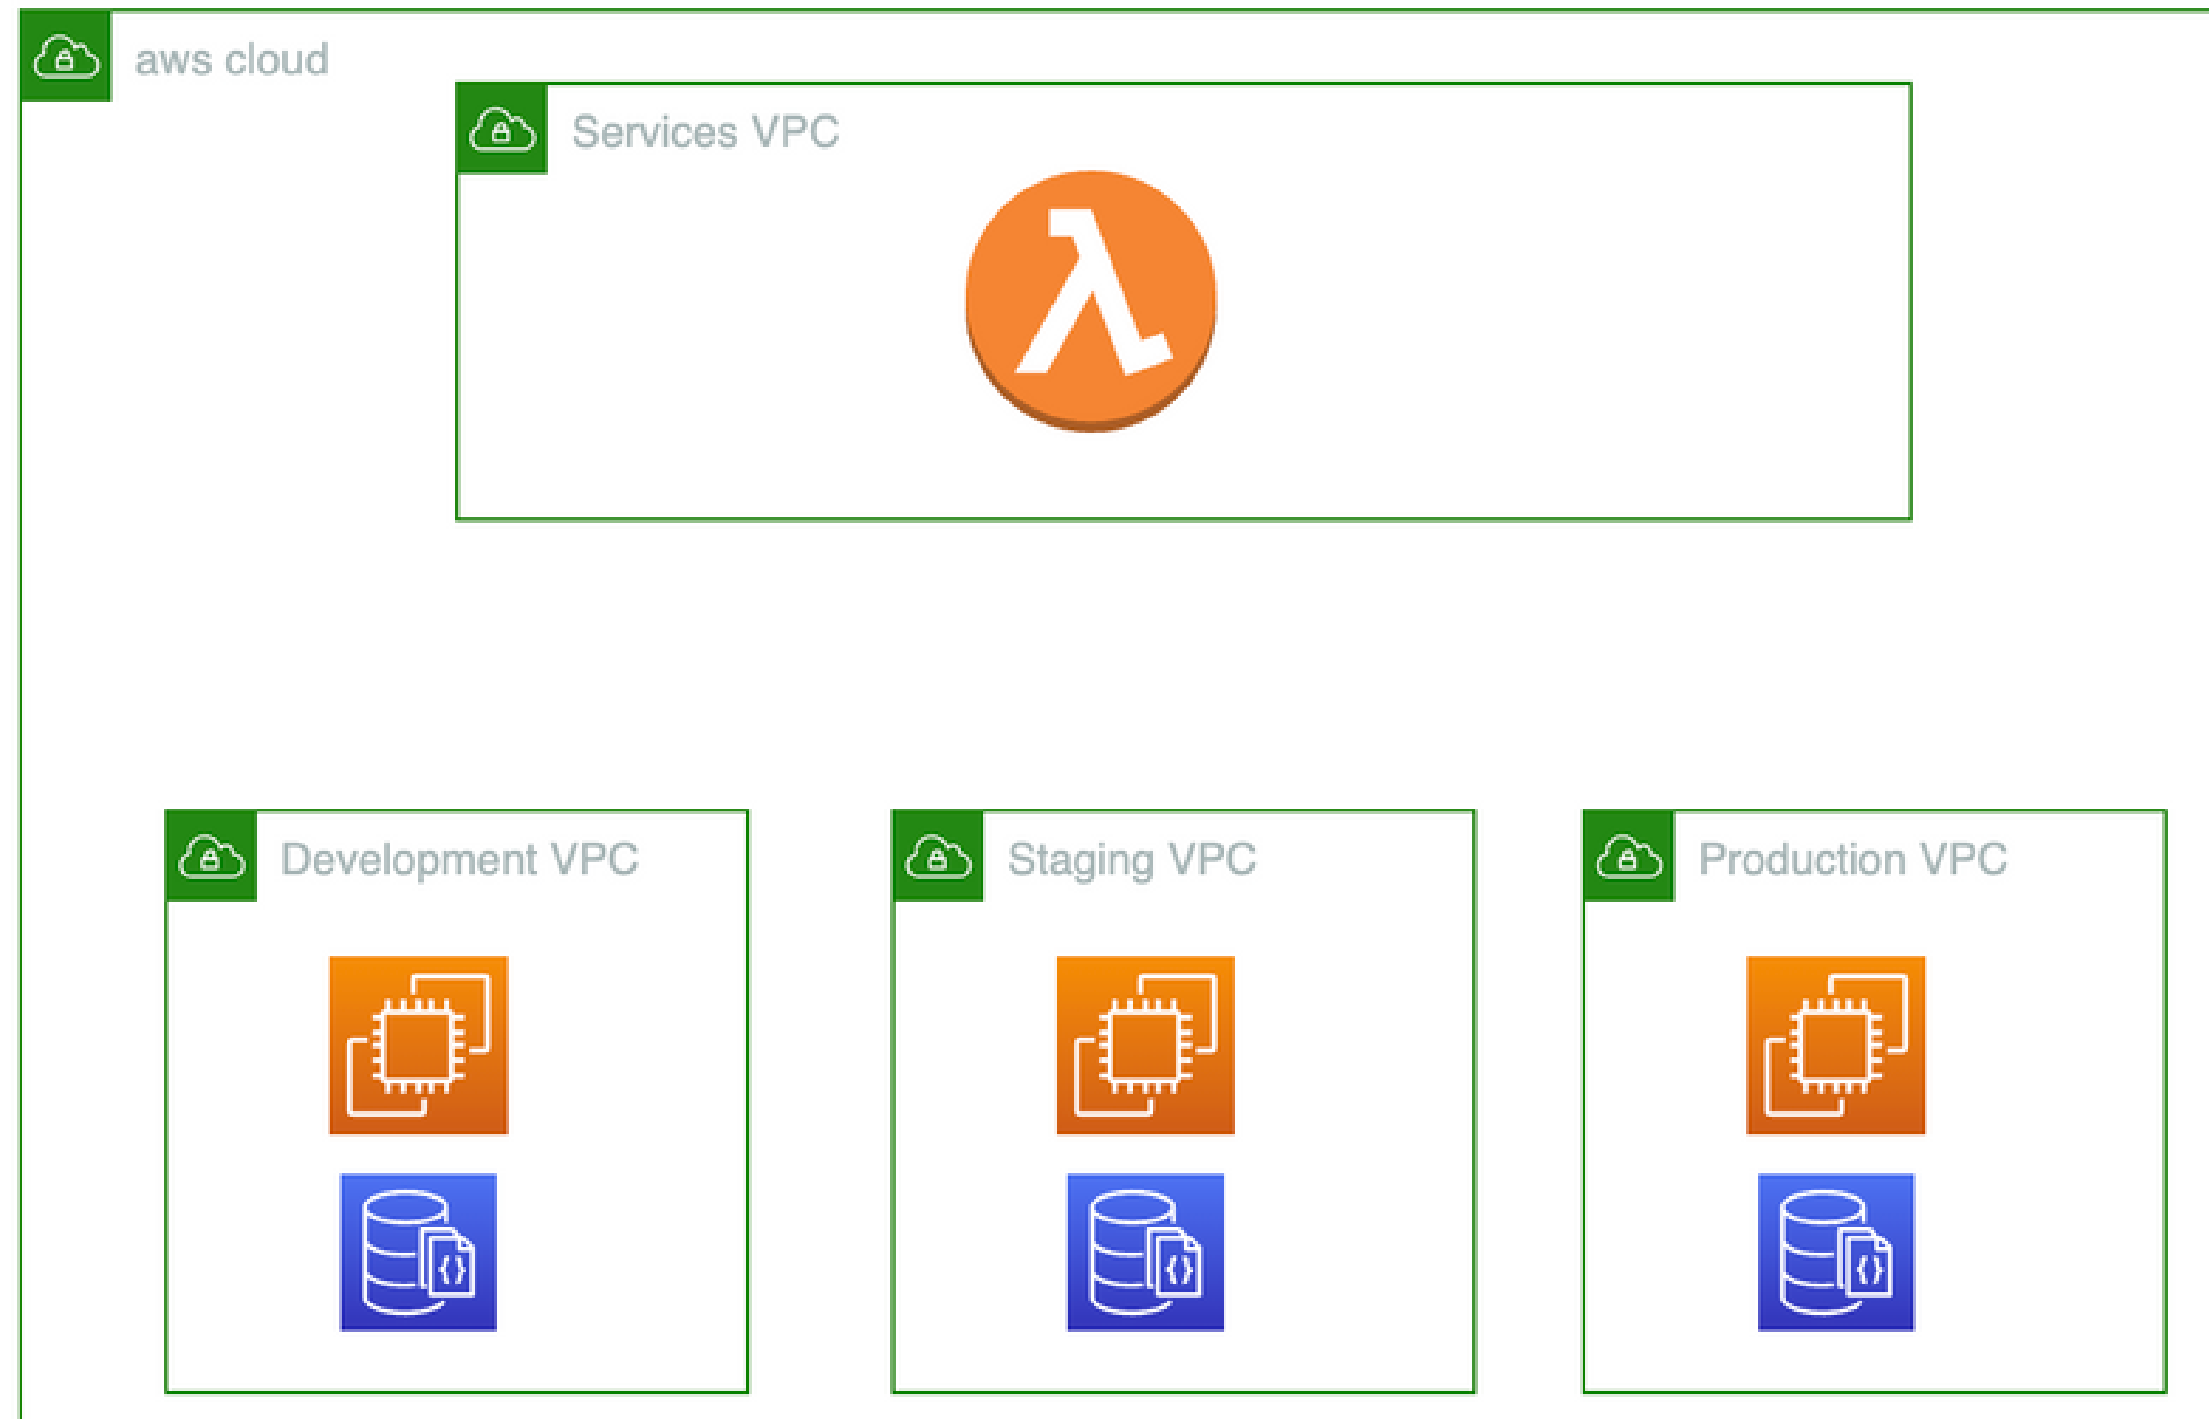

Reserved  
Concurrency

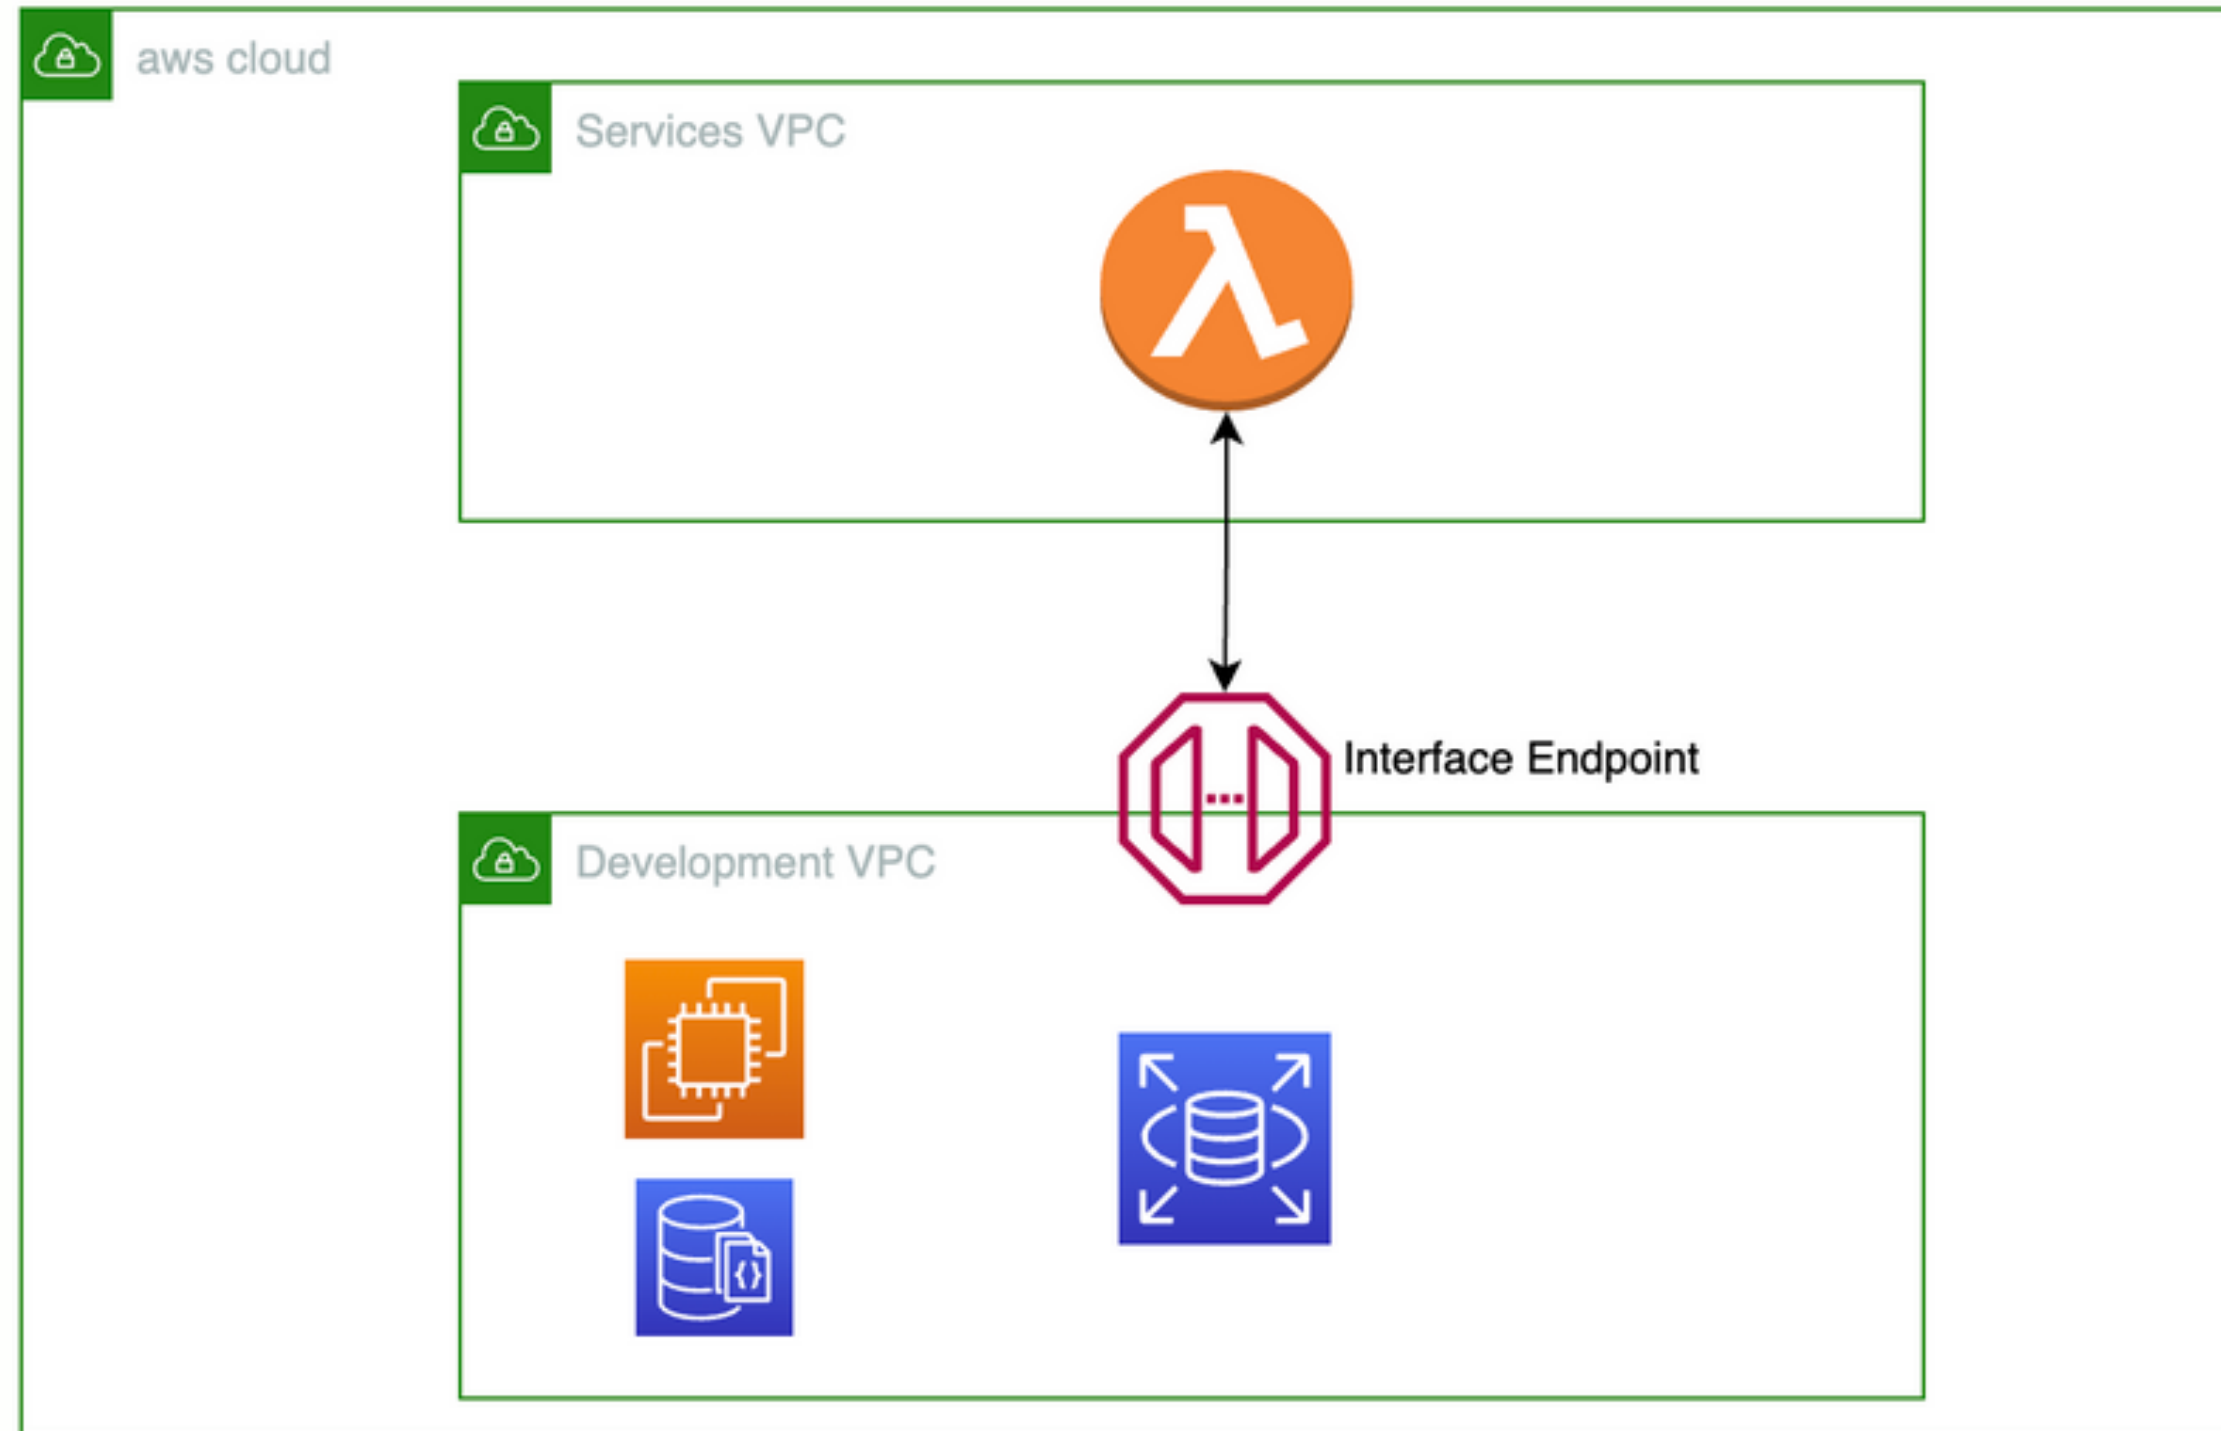

**throttle** refers to a mechanism that limits the number of concurrent function executions to prevent overwhelming a function or a downstream resource. When a function is throttled, it means that AWS Lambda has reached the maximum number of concurrent executions for the function

# Lambda Networking

# Lambda Networking

# Lambda Networking

**MONITORING**

# Monitoring, Logging and Tracing of Lambda Service

Amazon CloudWatch

- Number of requests
- Duration per request

AWS X-Ray

- virtual mapping
- identify performance bottlenecks and errors
- trace lambda function path

# Lambda Common Use Cases

## Data triggers

Triggers function on data changes in S3, SNS, SQS

## Big Data

Real-time processing of streaming data updates using Kinesis

## Control Systems

Customize responses and workflows to state changes within AWS services

## Serverless Backend

Execute Server-side backend logic

# Other use cases

## Scheduled Events(cron)

- start or stop an instance at specific time
- Log cleanup
- Batch data jobs
- Alarm Clock
- Infrastructure Automation
- Scheduled Backup

## Backup and Disaster Recovery

- Cross region replication
- Off-site backup

# BONUS KNOWLEDGE SHARING!

## Trends and the Future of IT

- 1 Internet of Things will explode as connectivity becomes more extensive! Thanks 5G!
- 2 Artificial Intelligence and Machine Learning technology will also flourish
- 3 Intelligent Automation will help simplify operations
- 4 Security
- 5 DevOps will be necessary in getting everything to work together efficiently
- 6 Edge Computing

# Do you have any questions?

Send it to me! I hope you learned  
something new.
